DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on July 29, 2008 has been entered. Applicant's IDS of July 29, 2008 has been fully and carefully considered.

2. Examiner's Comment:

The instant invention claims an apparatus whereas the claims in the 11/236,125 are drawn to a process of steam reforming. The apparatus claim of the instant claims is to a microchannel reactor which admittedly can be used for reforming but this has not been claimed. The structure of the reactor of the instant case has not been claimed in the '125 application. The structure of the microchannel reactor as claimed requires a connection between at least two microchannels, wherein the connection has a metal internal surface that as been coated with a vapor deposited buffer layer comprising a metal oxide wherein the buffer layer has a thickness of between 0.5 micron and 10 microns. The instant invention further has claims directed to a method of making the microchannel reactor the microchannel apparatus comprising a first layer and second layer wherein each of the first and second layers comprise at least one microchannel and subsequently vapor depositing a buffer layer on at least one interior wall of the microchannel in each of the first and second layers in the microchannel apparatus. The structure in the apparatus has not be claimed in the '125 application and are therefore patentably distinct inventions. With respect to the references to Wengeng et al., USP 5,811,062, Rao et al. USP 5,354,547, Konkoi et al.(GB 2066696), Lu et al., USP 5,855,676 and Dwyer, USP 3,887,741

none of these references either singularly or in combination teach a microchannel reactor and method of making a microchannel reactor wherein the microchannel reactor comprises a plurality of microchannels having a connection between at least two microchannels wherein the connection has a metal internal surface that has been coated with a vapor-deposited buffer layer comprising a metal oxide wherein the buffer layer has a thickness of between 0.05 microns and 10 microns representing the catalyst disposed within the microchannel reactor. In the most recent IDS filed July 29, 2008, a patent to Wilson et al. teaches a reforming process with a catalytic reactor which includes halided zeolite catalyst containing platinum in a metal coated reactor system. The catalyst and catalyst coating is patentably distinct from the claimed invention. In Wilson et al., the a bundled tube reactor, the tubes of the reactor are coated with a Halided Pt-L-zeolite catalyst prepared by painting the reactor system with tin containing paint and contacting the painted reactor with a hydrogen containing gas to produce stannides, followed providing a halided Pt L-zeolite catalyst and loading the treated halided Pt L-zeolite into the reactor system. The reactor structure of Wilson et al. do not teach or render obvious the catalyst system disposed within a microchannel reactor including at least two microchannels wherein the connection has at least a three layer construction - a porous upper layer, buffer layer, interfacial area and catalytically active area as claimed. The buffer layer thickness is nonporous and exhibits thermal and chemical stability at elevated temperature and stabilizes the catalyst layer and prevents side reactions from taking place. The thickness of the buffer layer is non-obvious and the art does not teach or suggest how one of ordinary skill would provide a thickness, which exhibit the characteristics and properties of the microchannel reactor.
